We provide a comprehensive delivery of the construction, i.e. we carry out the design of the solution, design, production and installation, including functional and pressure tests, revisions, construction modifications and documentation necessary for the handover of the work.

We offer our customers variable solutions for GPRS reconstruction with a view to improving the level of technical parameters of GPRS and reducing the resources spent on further operation of the equipment.

New and reconstructed GPRS can be equipped with monitoring and control system or odorization equipment at the customer's request.

We also offer GPRS or underground control sets, designed to be placed below ground level.
